Obviously nobody has tested it to see how much Glyphosate or Round Up the corn contains and as to whether this is detrimental to animal/ human health. Same as usual. Since we now know that Round Up in parts per trillion is detrimental to the body it simply amazing me that our government paid scientists go on with this game. It will have to stop, unless you are part of the plan of human depopulation. If it does produce increase in yields, so what. The first consideration is of what benefit it is to us to consume, I personally do not eat corn anyway unless it is signed off as organic. The whole system is skewed to chemical company profits and power. So sad as New Zealand is one of the better countries to live in and yet we are still being poisoned. We are still following the nonsense passed on from the USA regulatory authorities, every one of which is corrupted to serve their masters. The corporations who produce it. Anything that has been genetically engineered can noway be similar to other varieties of corn or other plants. It is so insane to even think that. You have yet to prove the point I am afraid. Hugh Halliday.
